

# GLOBAL INFLUENZA EPIDEMIOLOGICAL DATA COLLECTION TOOL

<https://extranet.who.int/fluid>

## Background and objectives

Fluid is a WHO web-based application for entry, collection and dissemination of epidemiological data on influenza. It complements the existing virological data collection tool FluNet ([www.who.int/fluNet](http://www.who.int/fluNet)). Currently Fluid is in pilot test phase: it allows countries to enter epidemiological data online and access processed information instantly. With the next version a complete comprehensive joint epidemiological and virological summary will be released. The final objective is to provide a comprehensive overview of the current influenza situation both globally and locally.

Future plans are for the tool, together with FluNet, to be the main provider for the influenza activity updates in all WHO regions. Automatically generated influenza country profiles and other data displays, such as maps, would be available online.

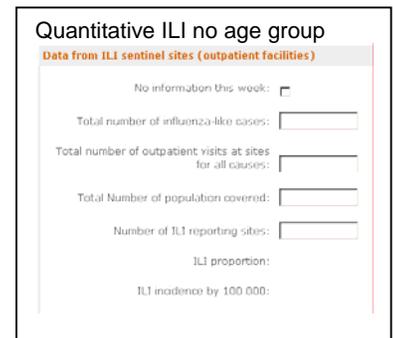

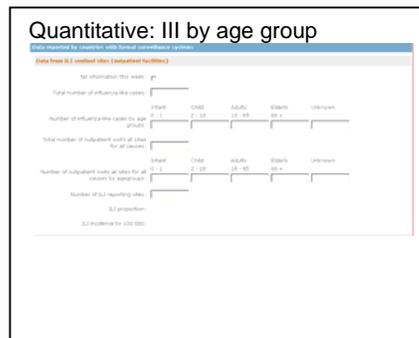

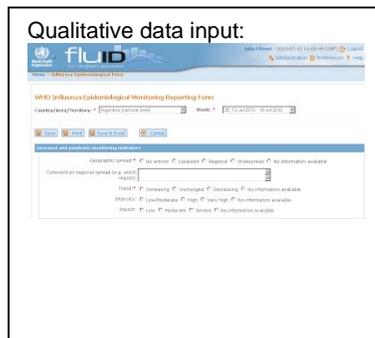

## Data submission

Data is submitted weekly from the national focal points for influenza surveillance or downloaded from regional networks (e.g. EUROFlu). The collected data include qualitative assessments of geographic spread, trend, intensity of transmission, and impact on health care systems as well as quantitative data from sentinel surveillance sites. Quantitative data include numbers of Influenza like Illness, Acute Respiratory Infection, Severe Acute Respiratory Infection and/or pneumonia by age

group, if available, and with the population denominator or total visits to the facility. Mortality data can also be captured. The quantitative data entry page is adaptable to accept the specific data collected by the country.

Examples of the data input screens:

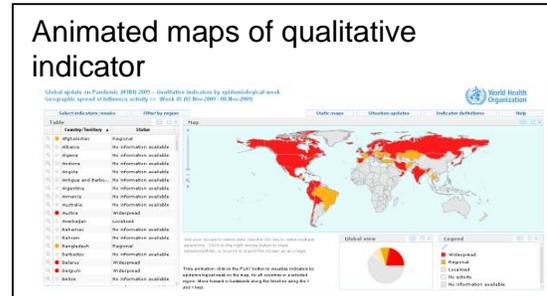

## Output

Data can be exported in Excel® and used for further analysis. Qualitative data is displayed in animated maps and a joint output of FluNet and FluID data, the "Influenza country profile", by country and week will be available with the new release.

**DATA EXPORT AND REPORTS**

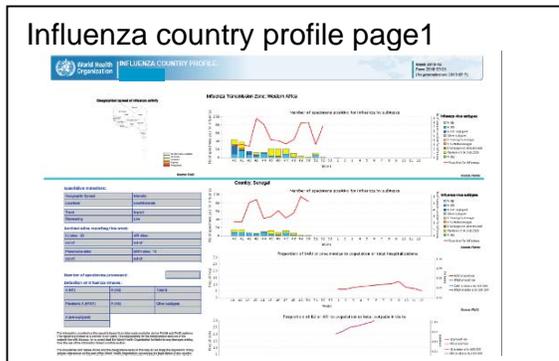

- Export Data
- Country Profile Report
- Maps of qualitative indicators

**Animated maps of qualitative indicator**

Global update on FluNet and FluID - Qualitative indicators by epidemiological week  
Geographic spread of influenza activity - Week 41 (21 Nov 2009) - 10 Nov 2009

Indicator	Indicator by region
Africa	Information available
Americas	Information available
Europe	Information available
South-East Asia	Information available
Western Pacific	Information available
World	Information available

Number of influenza cases by influenza B subtype

**Influenza country profile page2**

World Health Organization | INFLUENZA COUNTRY PROFILE

**Instructions**

**FluID**

**FluNet**

Number of influenza cases by influenza A subtype

Number of influenza cases by influenza B subtype

## Future

In order to provide what is needed from the countries and regions, users are asked for their feedback and we will try to improve the different parts of the tools accordingly. The software engine behind FluID is open source and can be further adapted to meet specific country and regional needs, including the addition of other disease reporting.

## Contact

If you wish to contribute or have any questions and/or comments, please don't hesitate to contact [fluid@who.int](mailto:fluid@who.int) for any further assistance.
